                                                                                                                                                                                                                                                        Alignment
                                                                                                                                                                                                                                                                                                                                               The present invention relates to transformants capable of producing PF1022 substance derivatives. These were obtained by transferring a gen participating in the biosynthesis pathway from chorismic acid to paminophenylpyruvic acid (biosynthesis gene) into a phenylalanine-requiring host derived from an organism producing the PF1022 substance.
                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel biosynthesis gene-transferred tr. substance derivatives by fermentation, drugs with anthelmintic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                S
                                                                                                                                                                                                                                                                                                              The transformants are producing PF1022 substance derivatives by fermentation, for use as pharmaceuticals or veterinary drugs. The sequence is a substance PF1022 coding sequence from Streptomyces

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            片
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S
                                                                                                                                   The invention relates to a novel composition comprising a translation comprising an orthogonal tRNA (O-RNA) and an orthogonal aminoacyl CENA synthetase (O-RS), where the O-RS preferentially aminoacylates the O-ERNA with at least one unnatural amino acid in the translation system and the O-ERNA recognises at least one selector codon. A composition of the invention is useful for producing at least one protein comprising at least one unnatural amino acid. The protein is the AsplITMG mutant of chloramphenicol acetyltransferase (CAT), the Tyr163TAG mutant of mouse chloramphenicol acetyltransferase (CAT), the Tyr163TAG mutant of mouse collydrofolate reductase (DHFR), or a Tyr163TAG mutant of mouse collydrofolate reductase comprising CHOOH Hisfeag. The unnatural amino acid is biosynthesised by the cell. The present sequence represents a plasmid containing the individual genes papABC that encode the enzymes used to carry out the conversion of chorismate to the unnatural amino acid p-aminophenylalanine (pAF)
                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                     Example 4;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 US-10-089-514-4 (1-103) x ABZ69799 (1-3305)
The invention relates to a novel composition comprising a translation system comprising an orthogonal tRNA (O-tRNA) and an orthogonal aminoacy tRNA synthetase (O-RS), where the O-RS preferentially aminoacylates the -tRNA with at least one unnatural amino acid in the translation system and the O-tRNA recognises at least one selector codon. A composition of the invention is useful for producing at least one protein comprising at least one unnatural amino acid. The protein is the Aspl2TAG mutant of chloramphenicol acetyltransferase (CAT), the Tyr163TAG mutant of mouse
                                                                                                                                                                                                                           Schultz

The unnatural amino acid is provided exogenously. The translation system is a cell and the unnatural amino acid is biosynthesised by the cell. The present sequence represents a plasmid for use in the biosynthesis of p-aminophenylalanine
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Streptogramin B; antibiotic; biosynthesis; pristinamycin; virginiamycin; DMPAPA precursor; 4-dimethylamino-L-phenylalanine; papA; papM; papB; papC; isomerisation; aromatisation; N-methyltransferase; ds.

The papA and papM genes of S.pristinaespiralis are involved in the biosynthesis of 4-dimethylamino-L-phenylalamine (DMPAPA), a precursor for pristinamycin IA. The region between these two genes was sequenced and two open reading frames were identified. The first (papC) was on the complementary strand and decodes to an amino acid sequence with homology to the region of E.coli TyrA which has been implicated in aromatisation reactions. The papC gene product is likely to be involved in a similar aromatisation of 4-deoxy 4-amino prephenate to give 4-amino phenylpyruvate during DMPAPA synthesis. The second open reading frame
                                     (papB) could be decoded to give a product with homology to the region of TyrA which has chorismate mutase activity. The PapB gene product is likely to catalyse the isomerisation of 4-deoxy 4-amino chorismate to 4-deoxy 4-aminoprephenate acid. Disruption of the papB and papC genes can be used to produce strains of S.pristinaespiralis which are unable to produce the antibiotic pristinamycin I but which may be able to produce new, modified forms of it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New streptogramin B derivs. useful as antibiotics - produced by remutants of Streptomyces having altered genes for streptogramin B

                                                                                                                                                                         complementary strand and decodes to an amino acid sequence with homology to the region of E.coli TyrA which has been implicated in aromatisation reactions. The PapC gene product is likely to be involved in a similar aromatisation of 4-deoxy 4-amino prephenate to give 4-amino phenylpyruvate during DWPAPA synthesis. The second open reading frame (papB) could be decoded to give a product with homology to the region of TyrA which has chorismate mutase activity. The PapB gene product is likely to catalyse the isomerisation of 4-deoxy 4-amino chorismate to 4-
                                                                                                                          deoxy 4-aminoprephenate. Disruption of the paph and papC genes can used to produce strains of S.pristinaespiralis which are unable to produce the antiblotic pristinamycin I but which may be able to pronew, modified forms of it

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polypeptides encoded by the genes are used for detection/identification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that modulate, regulate, induce or inhibit expression of the genes in plants, animals or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antiblotics produced by P. luminescens. Cells transformed to express the genes are useful for recombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The

Other uses of the genes and the proteins are as virulence factors and for identifying targets of human diseases for which P. luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Match:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes a new isolated nucleic acid encoding a Klebsiella pneumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This sequence encodes a Klebsiella pneumoniae of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acid encoding a Klebsiella pneumoniae polypeptide, preparing a vaccine composition against Klebsiella pneumoniae.

                                                                                                                                                                                                        invention are useful for producing a plant such as canola, maize, Arabidopsis, Brassica campestris, B.napus, soybean, crambe, mustard, castor bean, peanut, sesame, cottonseed, linseed, safflower, oil palm, flax and sunflower having increased tocopherol levels, especially alpha-or gamma-tocopherol or tocotrienol relative to a plant with a similar genetic background but lacking the exogenous nucleic acid molecule. They are useful for reducing tocopherol levels in a plant. They are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  biosynthesis useful for enhancing or al plants such as canola, maize, soybean, peanut, sesame, or cottonseed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel nucleic acid molecule encoding enzymes involved in tocopherol biosynthesis useful for enhancing or altering tocopherol production plants such as canola, maize, soybean, crambe, mustard, castor bean,
                                                                                                                                                                              useful for producing plant expressing homogentesic acid and plastoquinones. The present sequence is Erwinia herbicola bifunctional
                                                                                                                                                                                                                                                                                                               chorismate mutase activities or a tyrA from Erwinia herbicola or Escherichia coli bifunctional prephenate dehydrogenase. No. is the number of results predicted by chance to becore greater than or equal to the score of the result being and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DB DB

Sequence 1138 Application US/09543681A
Patent No. 6605709
GENERAL INFORMATION:
APPLICANT: GARY BRETON
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACITILE OF INVENTION: NUCLEIC ACID AND THERAPEU FILE REFERENCE: 2709.1002-001
CURRENT APPLICATION NUMBER: US/09/543,681A
CURRENT FILING DATE: 2000-04-05
PRIOR APPLICATION NUMBER: US 60/128,706
PRIOR TILING DATE: 1999-04-09
NUMBER OF SEQ ID NOS: 8344
SEQ ID NO 1138

Pred. NO. is the number of results predicted by chance to have

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
